The JS Errors section shows two errors, one is intentionally set up by myself (Test Atatus Setup), one is Network Error.

Test Atatus Setup Error could be resolved by removing `atatus.notify(new Error('Test Atatus Setup'))` in `Index.js`.

Network Error, first I thought it might be the logo in `index.html` file so I removed it but it doesn't seem the reason of this error. I also realized it's only triggered when I cleared my cookies and then log in again.

Apdex score is 0.93. Web Vitals section indicates LCP(largest contentful paint)and TTFB(Time to first Byte) could be improved.
